Your Claude reads the lease. LeaseIntel makes sure nothing in it gets missed.

LeaseIntel is a lease obligations desk for businesses that rent many locations. The customer's own Claude reads each lease through MCP and saves the key terms with the exact clause each came from. A person verifies them, then LeaseIntel keeps every deadline, rent increase and monthly payment live for the life of the lease. No AI runs inside the app.

01 The problem

A chain with 30 outlets has 30 leases of 20 to 60 pages each. The money and dates are spread across clauses: a lock-in, a notice period, a renewal option with its own notice window, and rent that rises every year or every three years. Indian leases commonly run 3 to 9 years, so whoever signed is often gone when a deadline arrives.

Today this lives in Excel, calendar reminders and memory. When it slips, the cost lands per location: a renewal option at a good site lapses, an escalated invoice is paid for months without anyone checking the maths, or a loss-making store pays rent past the date it could have exited.

Example from the sample lease in the demo (fictional): Indiranagar cafe, rent ₹1,80,000 rising 15% on the last paid fee every 36 months. The renewal option needs written notice 6 months before the term ends, so the real deadline is **30 Dec 2026**, not the 30 Jun 2027 expiry most people would put in a calendar.

02 Target customers

Who buys: the finance controller or head of expansion at an Indian chain with **10 to 60 rented locations** (cafes and QSRs, salons, clinics, pharmacies, coaching centres, cloud kitchens). Big enough that leases have outgrown a spreadsheet, small enough that one person decides and enterprise lease software is far too heavy.

Why them first: one finance lead can say yes, rent is already paid by a finance team that wants a schedule it can trust, and they are reachable through founders' networks and their CA firms. Next: Singapore and Gulf chains (the app already handles INR, SGD and AED with separate totals).

03 Alternatives and why we win

ALTERNATIVE	WHERE IT FALLS SHORT FOR THIS BUYER
Excel + reminders	No clause evidence, no maths on escalations, breaks when people leave
Lease accounting tools (LeaseQuery, LeaseGuru, Visual Lease)	Built for IFRS 16 / ASC 842 accounting; LeaseGuru lists $999 a year for 10 leases
US multi-unit tools (Leasecake)	Abstraction is a paid service; pricing on request, pitched as under 1% of rent

Our edge: setup takes minutes because the customer's Claude does the reading, every term is tied to its clause and verified by a named person, and with no AI cost we can price well below these tools while handling leave and license, lock-ins and GST scope.

04 Business model and pricing

India	Singapore, Gulf, rest of world
₹399	**$6**
per location per month	per location per month

A 25-location chain pays about **₹1.2 lakh a year**. The entry offer is a **free lease health check**: send three leases, see the next 12 months of deadlines and rent steps the same day. Later add-ons: Ind AS 116 schedules, landlord-invoice checks and rent payment through partners.

Costs. No AI cost: the customer's Claude does the reading. Hosting (Vercel + Neon Postgres) is about $35 a month shared across customers (estimate). The real costs to serve are onboarding, support, sales time and a security review, unknown until the first pilots. The price is a hypothesis to test with 10 finance leads.

05 Growth potential

TARGET (NOT A FORECAST)	MATHS	ARR
Year 1	100 chains × 20 locations × ₹399 × 12	**₹95.76 lakh**
Year 3	1,000 chains × 25 locations × ₹399 × 12	**₹11.97 crore**

First 100 customers: the free health check; CA firms that already audit these chains, as referral partners; founder-led outreach to finance leads in Bengaluru, Pune and Mumbai; and a spend platform that serves the same finance team.

Why this fits Volopay. Rent is one of a chain's largest fixed costs and a recurring vendor payment. LeaseIntel produces what bill pay needs: verified rent, CAM and GST per landlord, the month each amount changes, deposits and commitments, in INR and SGD. A rent payee fed by the approved schedule is an idea, not built or discussed with Volopay; today the bridge is CSV export.

Live, connected to Claude, and every value Claude writes can be checked and edited by a person.

Links for reviewers

Live app	https://leaseintel.vercel.app
Test login	`demo@leaseintel.app` / `leaseintel-demo`
MCP link	`https://leaseintel.vercel.app/mcp/li_demo_volopay_2026`
Sample leases	leaseintel.vercel.app/samples (3 fictional PDFs)
Code	github.com/pmInTheLoop/leaseintel

Connect in one minute

1. Claude → **Settings** → **Connectors** → **Add custom connector**.
2. Name `LeaseIntel`, URL = the MCP link. Leave OAuth empty, click Add.
3. In a new chat, turn on LeaseIntel in the tools menu.
4. Attach a sample PDF and say: *"Add this lease to LeaseIntel."*

Claude Code: `claude mcp add --transport http leaseintel <MCP link>`. "Reset demo workspace" on the Connect Claude page restores the sample data.

01 How the Claude integration works

IN CLAUDE	IN LEASEINTEL	A PERSON	IN LEASEINTEL	IN CLAUDE, LATER
Claude reads the PDF	**Stored as "Needs review"**	**Verify, fix, approve**	**Dates and rent go live**	**Claude acts on it**
Calls `create_lease` with up to 23 terms, each with the exact clause quote, its reference, and a note on anything unclear.	Values are validated; nothing is live yet. Claude gets back a link.	Each term sits next to its quote. Approve stays locked until every key term is verified.	Lock-in, exit notice, renewal deadline, escalations, expiry and a monthly rent schedule.	"What needs attention in 90 days?" Claude reads the live portfolio and saves a renewal notice draft.

8 MCP tools. Read: `list_portfolio`, `get_lease`. Write: `create_lease`, `update_lease_terms`, `propose_amendment`, `add_location`, `save_document`, `mark_action_done`. The server tells Claude its rules: quote clauses word for word, leave out terms the lease does not state, flag doubts instead of guessing, and send amendments as proposals. LeaseIntel does all date and money maths itself, so no legal deadline depends on a model's arithmetic.

02 Product functionality

- **Portfolio:** rent outflow per currency, money left to pay, a "Needs your attention" list (reviews, deadlines in 90 days) and a lease register.
- **Date engine:** last day of lock-in, when exit notice can be served, the renewal deadline counted back conservatively, every escalation and expiry. Each can be marked done.
- **Rent schedule:** month by month, rent + CAM + tax, tax only where the agreement applies it; exact money maths, CSV export.
- **Amendments:** Claude proposes changed terms from an addendum; old terms stay until a person accepts each change.
- **Letters:** Claude's renewal or exit notices are saved as drafts; LeaseIntel never sends anything.

03 Editing experience

- **Every term is editable in place** next to the clause Claude quoted. Saving marks it verified by that person, with name and time.
- **Claude's doubts are shown.** In the Indiranagar sample Claude flags that the lease is unclear on serving exit notice during lock-in; the reviewer decides.
- **Approve stays locked** until every key term is verified. If Claude later changes a key term, the lease goes back to review.
- **Letters** are edited like a document, then marked sent by a person.
- **Full history:** an append-only log keeps every change with old value, new value, who (Claude or a named person) and why.

> "...increased by fifteen percent (15%) on the last paid license fee at the end of every thirty-six (36) months..."

Clause 4.1, quoted by Claude. In the end-to-end test Claude sends 5%; the reviewer corrects it to 15% and the schedule updates.

How it was checked

57 automated tests, including an end-to-end run where a real MCP client (the protocol Claude uses) creates a lease, a person edits and approves it, Claude reads the change back, and data survives a restart. Every quoted clause in the three sample PDFs is checked word for word.

Honest limits and next steps

The MCP link is a secret URL; OAuth comes before real customer data. No OCR or PDF storage, no email sending, no Volopay or ERP integration yet (CSV export today). Next: 10 customer calls to test the price, then Ind AS 116 schedules.
